A variable-sweep wing, colloquially known as a "swing wing", is an airplane wing, or set of wings, that may be swept back and then returned to its original straight position during flight. It allows the aircraft's shape to be modified in flight, and is therefore an example of a variable-geometry aircraft.. A straight wing is most efficient for low-speed flight, but for an aircraft designed for ...

How much has the wing has developed over time?

Delta wings: have reasonable performance at subsonic and supersonic speeds. Wave-Riders: are efficient supersonic wings. Rogallo wings are two hollow half-cones of fabric, one of the simplest wings to construct. Swing-wings (or variable geometry wings) are able to move in flight to give the benefits of dihedral and delta wing.
